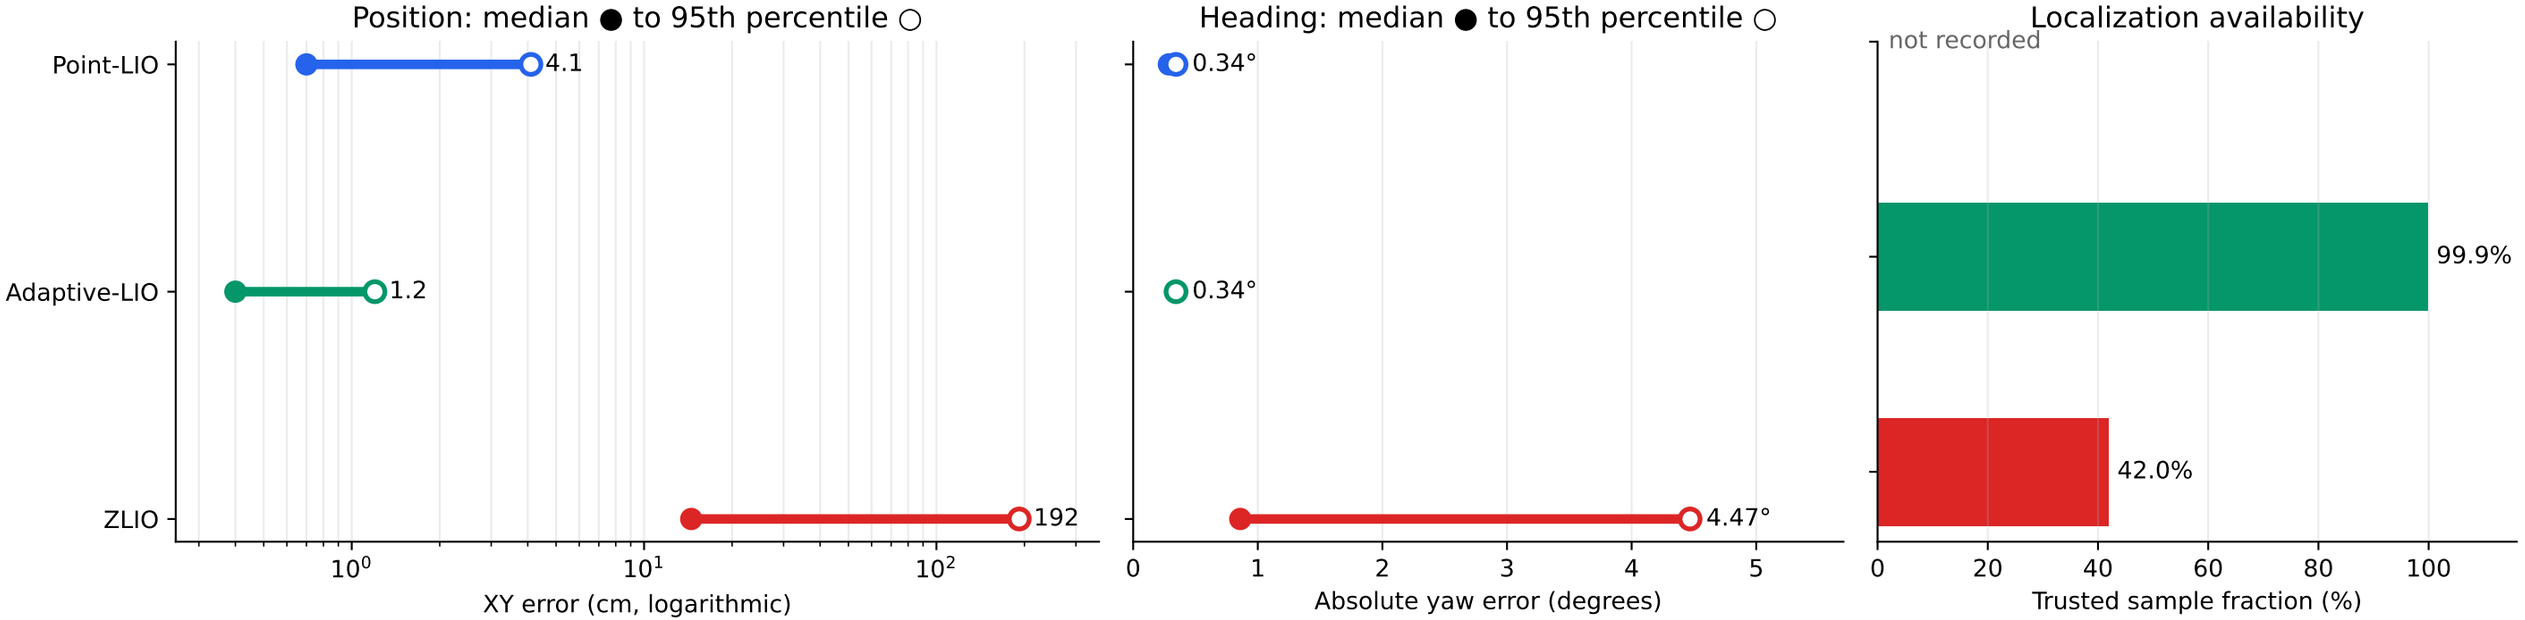
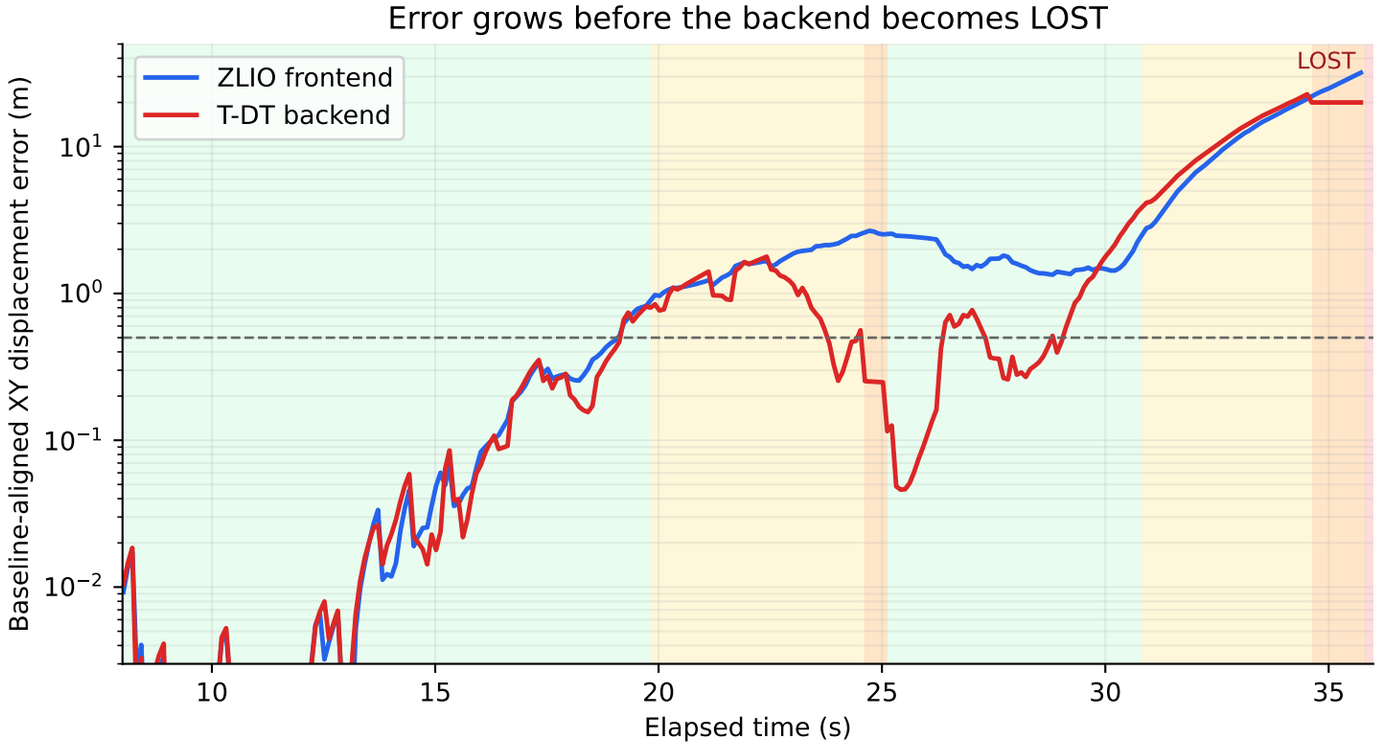
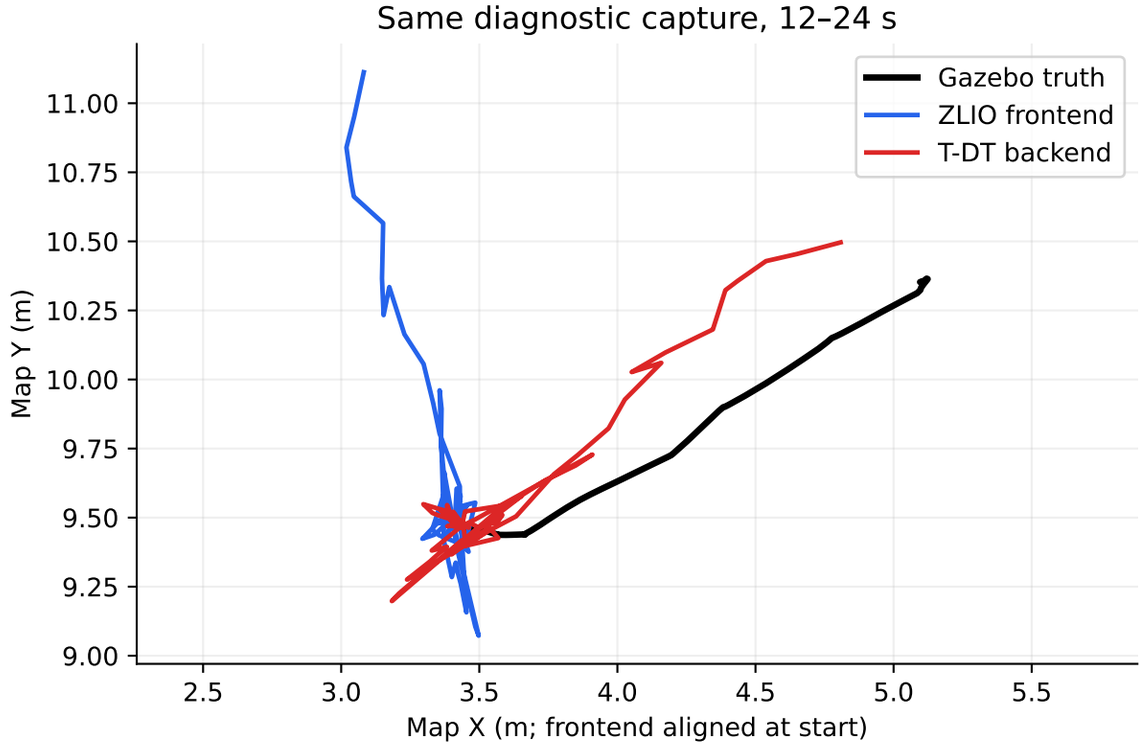
T-DT simulated navigation: recorded acceptance runs



One run per frontend; path displacement: Point-LIO 0.736 m, Adaptive-LIO 0.749 m, ZLIO 1.393 m. Error percentiles use trusted, time-matched samples only.
Point-LIO trust fraction was not logged; ZLIO ended LOST, so its error dots exclude untrusted intervals.

ZLIO navigation failure: separate 10 Hz diagnostic capture





Latest-message snapshots; rows kept only when each pose stamp is within 50 ms of truth. XY origins aligned by median of stationary 8–12 s.
These are drift curves, not absolute-pose accuracy. State background: green NORMAL, yellow degraded, orange SUSPECT, red LOST.
